

Disruptive Innovations in Image Acquisition: Is this the END?

Denis Le Bihan

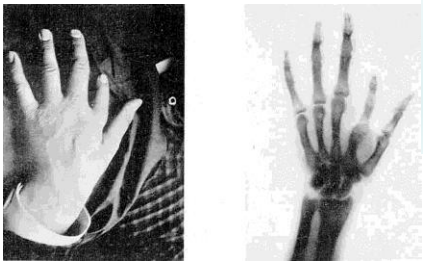

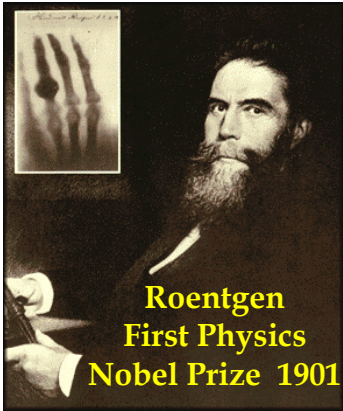

Founding Director, NeuroSpin, Saclay, France

Two mainstreams for medical technology development

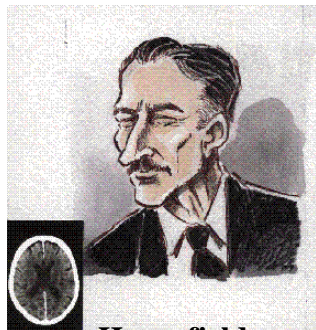

- **Cumulative process:** Progressive, incremental changes in basic knowledge of certain technologies over a long time, until **radical change** occurs
- Discovery or development of a technology initially **without medical purpose**

Disruptive Innovations in Image Acquisition: ... UNPREDICTABLE!

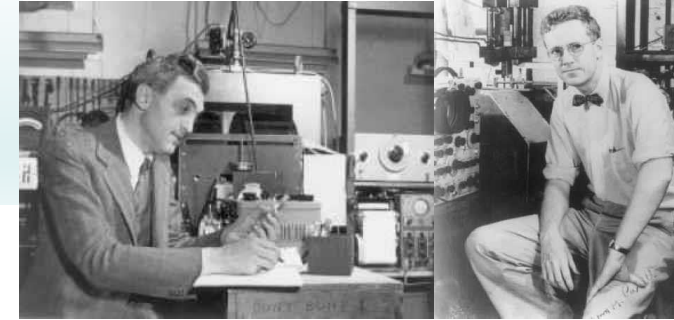

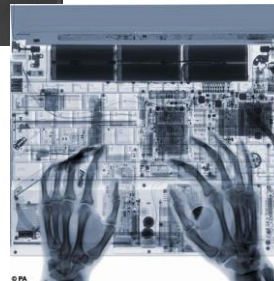

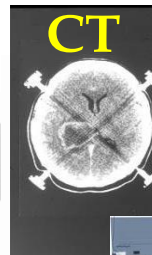

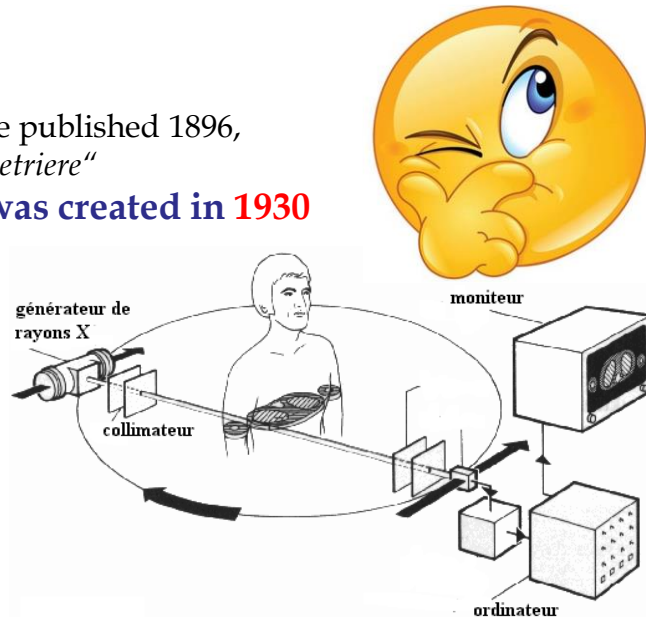

"Röntgen photography" plaque published 1896,
"Nouvelle Iconographie de la Salpetriere"

→ The "radiology" field was created in 1930

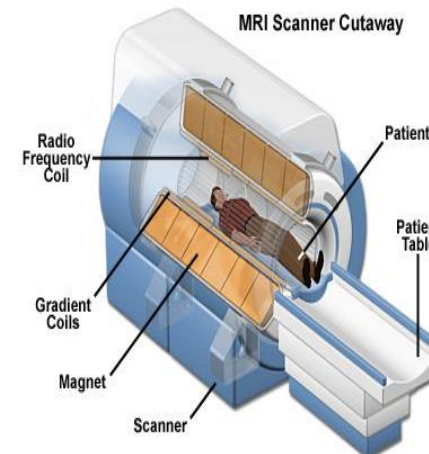

Hounsfield

Urbana, IL, USA

b. 1929

Sir Peter Mansfield
1/2 of the prize
United Kingdom
University of Nottingham,
School of Physics and
Astronomy
Nottingham, United Kingdom

b. 1933

LIFE CYCLE OF TECHNOLOGY (LCT)

Technology travels in time: Is born, grows up, decline and die

➤ Understanding LCT+++

- To predict the ability to **recover** development investment
- To **predict** when to plan new projects
- To **estimate** future developments
- To decide whether or not to **invest**

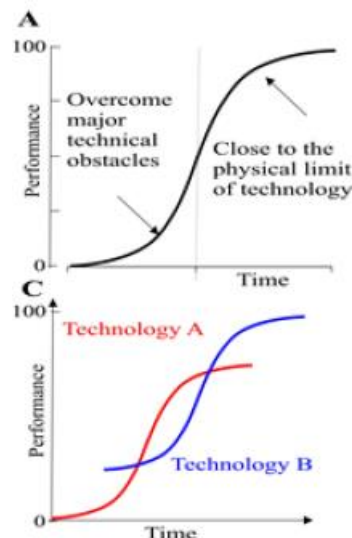

Innovation is one of the most sensitive meeting points between **material and psychological viewpoints**.

Success of innovation is almost **independant from technical novelty**.

➤ LCT: S-curve

(Performance against unit of effort/money invested)

- Initial slow performance: fundamental not well understood
 - Acceleration of performance (better understanding)
 - Slows down when the technology reaches its limits
 - identify discontinuity in an emerging technology that replaces a mature technology
 - identify birth of new market opportunities
 - identify death or obsolescence of the technology market
 - technological progress: succession of S curves:
- New S curve at the end of an Old S curve (ex: CT and PET-CT)

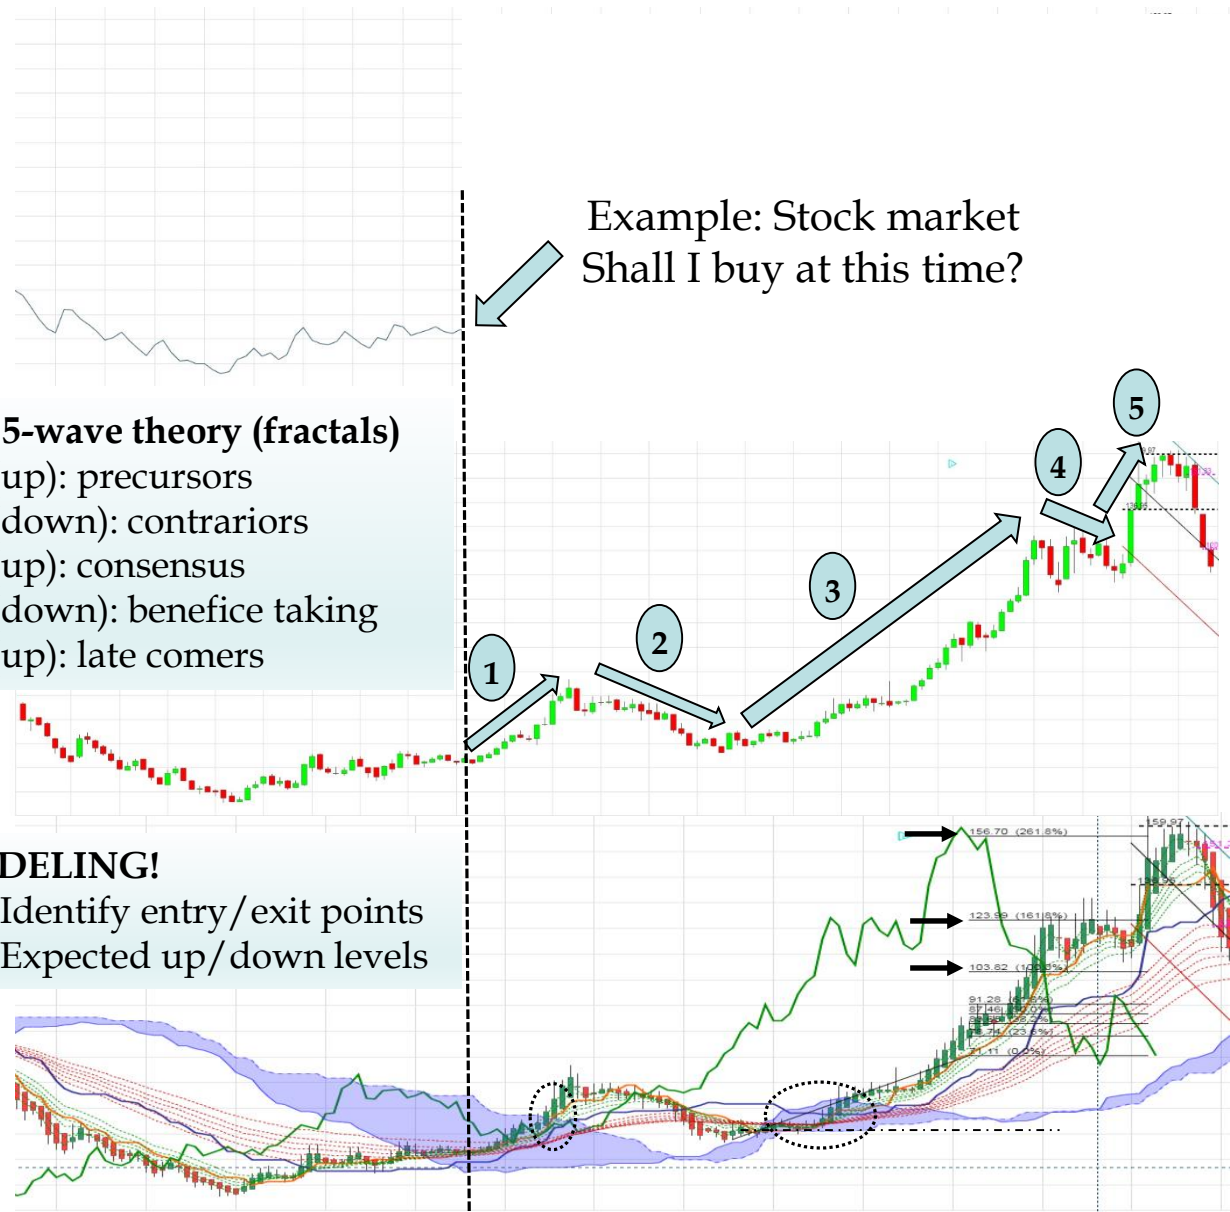

Elliott 5-wave theory (fractals)

- 1 (up): precursors
- 2 (down): contrarioris
- 3 (up): consensus
- 4 (down): benefice taking
- 5 (up): late comers

Example: Stock market
Shall I buy at this time?

MODELING!

- Identify entry/exit points
- Expected up/down levels

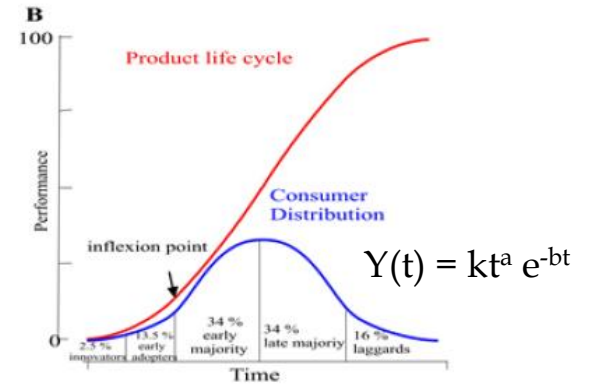

Time line connected to « market adoption » (spread of technology)

➤ S-curve: Diffusion of technology against cumulative number of adopters of technology over time:

- Slow at the beginning (introduction to market)
- Accelerates and is used in mass
- Market saturated

→ Model to **predict when a technology reaches its limits**, identify and move to a new technology

➤ Modeling (Rogers 2003, Moore 2014) of the transition from early visionaries market to mass market (Rogers 2003, Moore 2014)

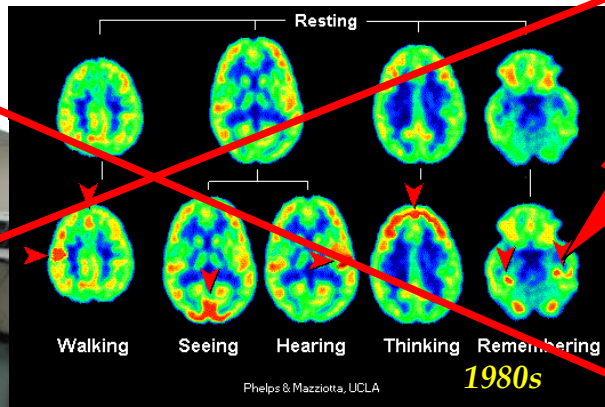

- Innovators (2.5%) & early followers (13.5%): understanding technology and performance
- Early (34%) and late (34%) majority: solution and comfort
- Sceptics (16%)

→ **Chasm**: breakpoint between early followers and early majority. Point where technology dies or survives (expected performance/revenue)

➤ Limitations:

- True limits not really known in advance, large disagreements between companies
- Firms can modify the S-curves through their R&D
- **Unexpected changes may occur in the market**

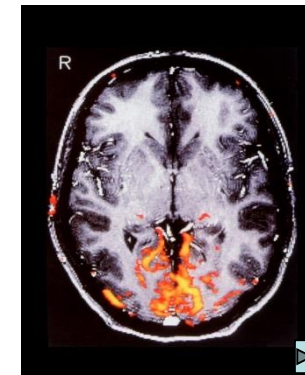

~~¹⁵O PET
functional neuroimaging~~

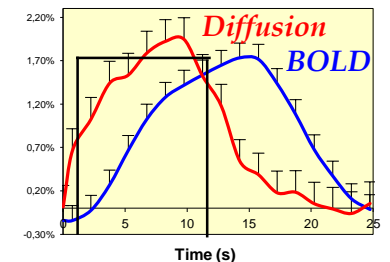

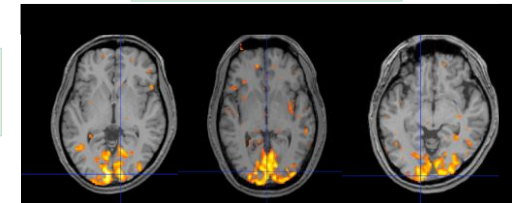

Gd based fMRI
1991

BOLD fMRI
1990-1992

Diffusion fMRI?
2001-2006

Example of X-ray technology

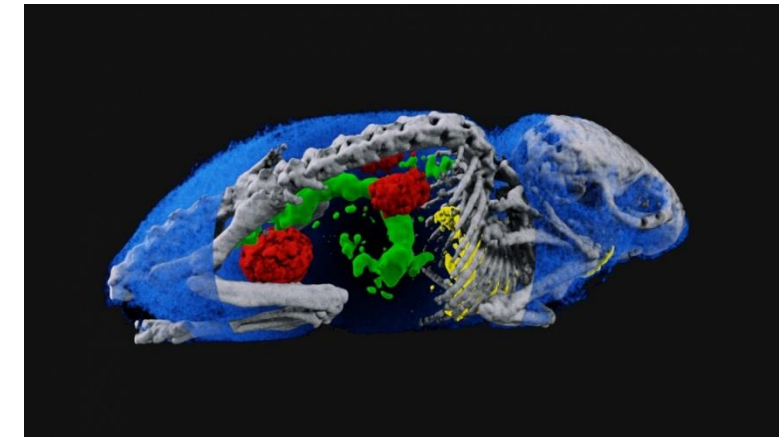

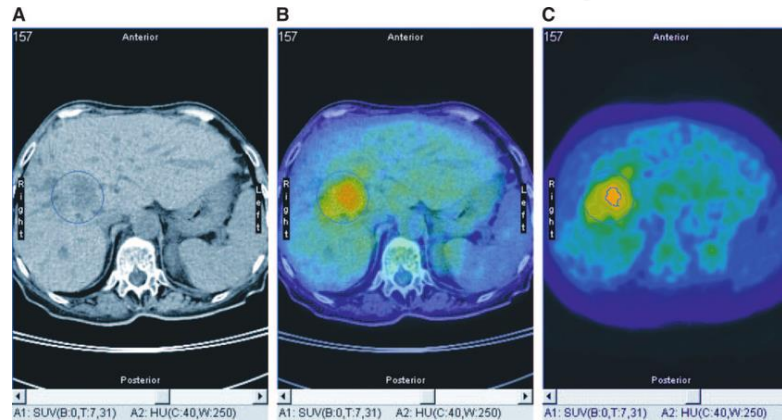

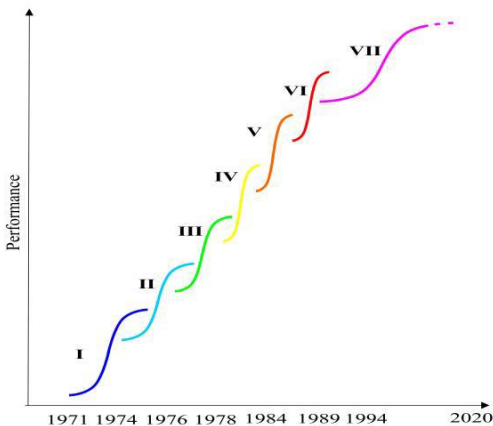

- X-ray technologies generate the largest Medical Imaging Technology income by far
 - New CT users build up on X-ray imaging
 - CT: incremental improvements (7th generation).
- Vacuum market at the beginning, now mature stage, decline expected from S-curve pattern?

→ PET-CT 1st prototype: 1991, first sold: 2001, *currently growing phase*
HYBRID SYSTEMS: Anatomy AND Function

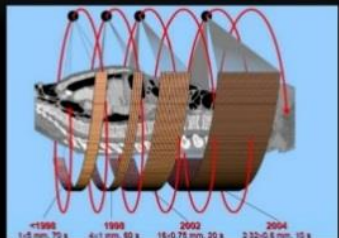

X-ray (film based) 1895

CT 1971

PET-CT 1991

SCANNER MULTI-BARRETTES (MDCT)

- Detector technology for the needs of the **CERN Large Hadron Collider (LHC)** experiments
- Extension to the medical imaging field.
- Third generation of read-out chips allows 'colour' imaging during CT scans (*spectral imaging*) providing information about the density and the atomic structure of a tissue. (still in the *emerging phase* and has not been widely adopted)

HYPE CYCLE (Gartner)

➤ Technology Trigger

- Breakthrough, public, press and industry interest

➤ Peak of Inflated Technology

- Over-enthusiasm, unrealistic projections, success

➤ Trough of Disillusionment (« Death Valley », chasm)

- Growing failures toward the limits, disappointment

➤ Slope of enlightenment

- Solid hard work, true understanding of usage, risks, benefits

➤ Plateau of Productivity

- Real benefits demonstrated and accepted, stability of tools, reduced risk, adoption

❖ Death valley, chasm: need to reach « early majority » customers

- Need for financial resources to allow performance to generate enough revenues
- Segment the market, find niche within a larger market
- Attack competitors on small segments through proper positioning

- **CT, MRI, PET:** now adopted by « skeptics », *productivity plateau, slow decline phase will start soon?*

- **Hybrid PET-CT:** early majority, *slope of enlightenment*

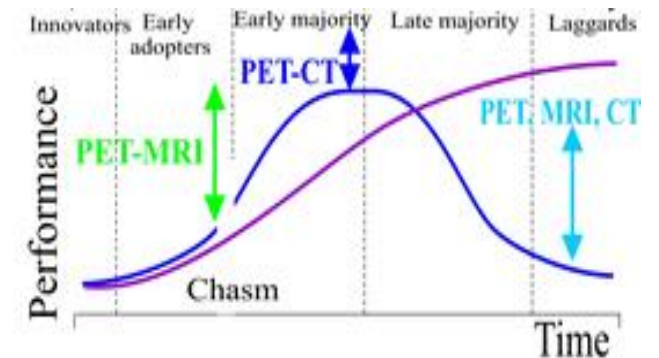

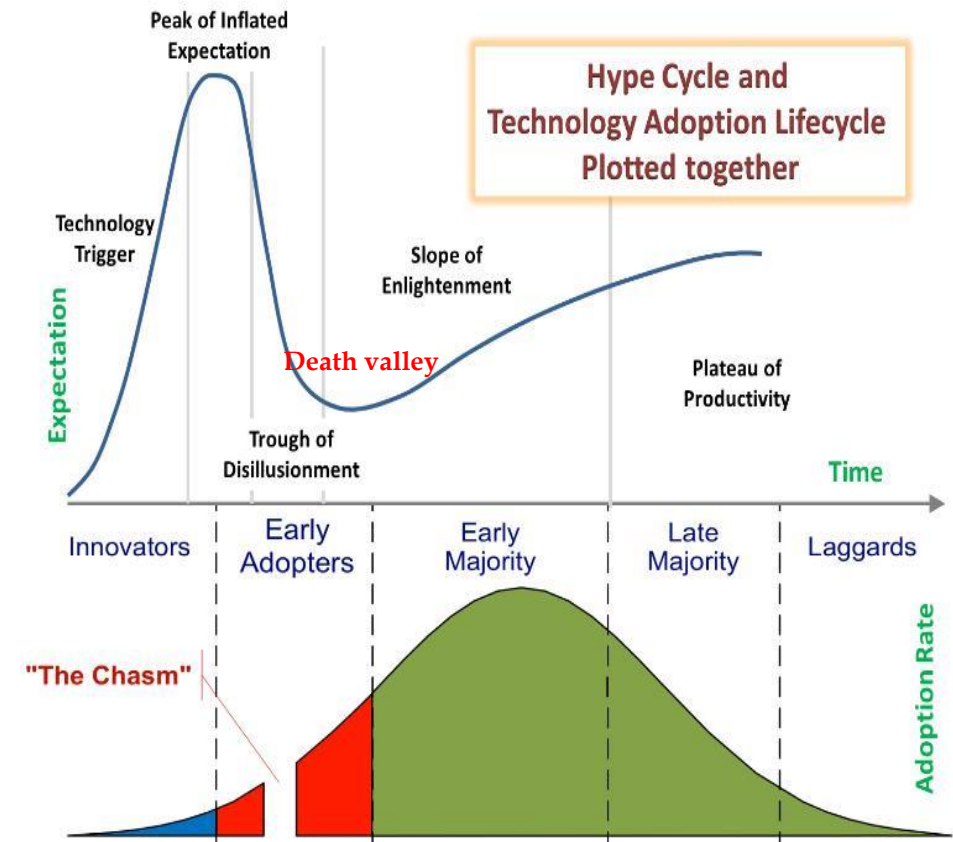

- **Hybrid PET-MRI:** development started in late 1990s, first prototype by Siemens 2008.

High complexity, cost (equipment, hospital infrastructures, tracers+++)

Early adopters, enters the death valley (performance? cost? Policymakers+++)

- Need to have pre-market information on **regulation mechanisms** which may affect cost-benefit, risk, effectiveness

- **Sensitivity to MARKET of raw materials**

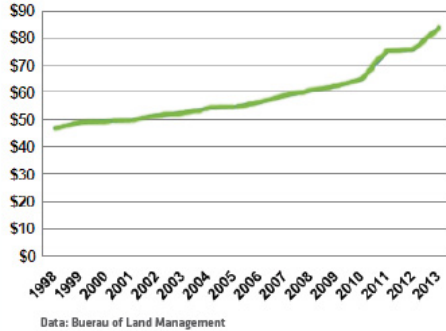

WORLD MRI MARKET

2018: \$5 billions

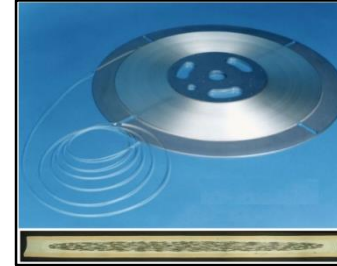

The liquid helium crisis (MRI)

World Helium Resources	
Country	Billion Cubic Metres
United States	20.6
Qatar	10.1
Algeria	8.2
Russia	6.8
Canada	2.0
China	1.1

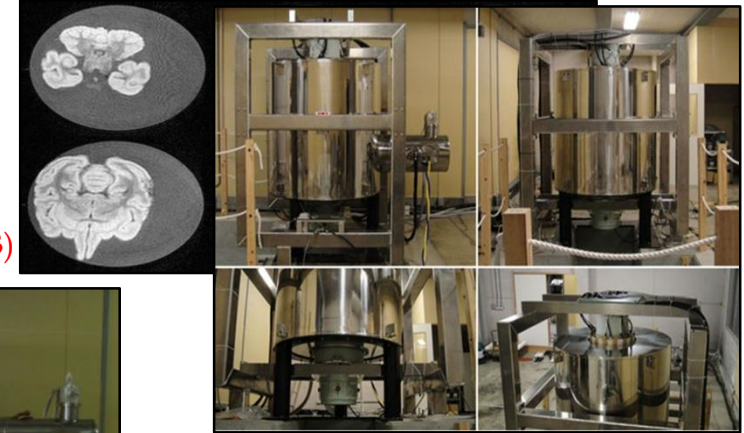

The values above are estimated helium resources from the USGS Mineral Commodity Summary

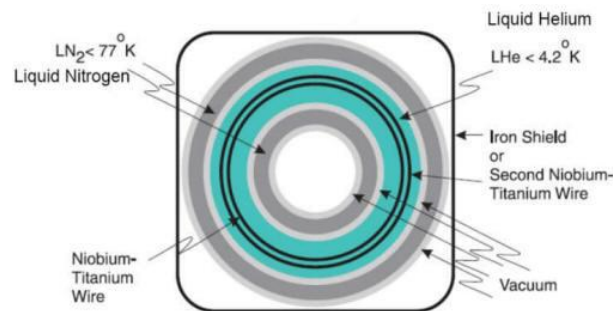

Helium free magnets?

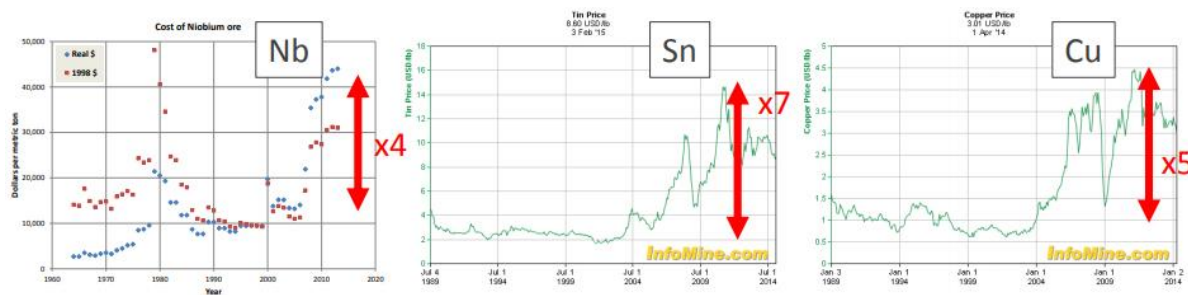

DI-BSCCO Type HT (Bi-2223)

Niobium-Titanium solenoid design @ 4.2°K (supraconductivity)

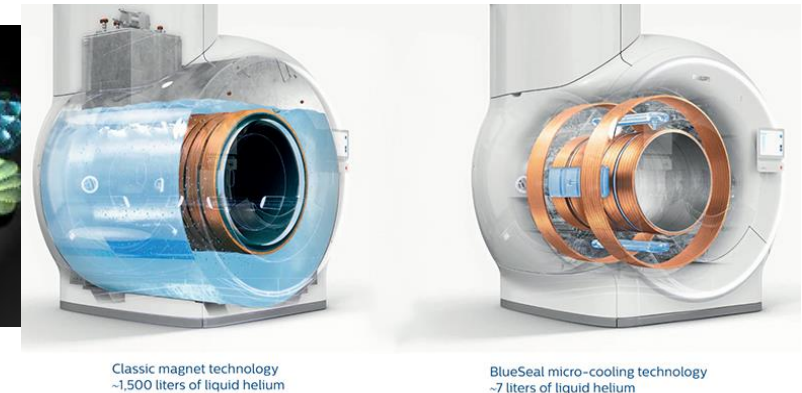

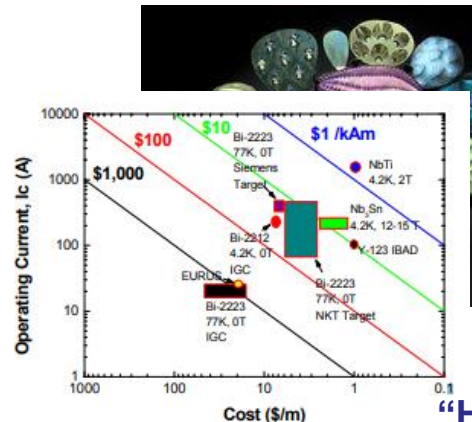

Kyoto U. 1.5-3T HTC MRI system
Can be turned on/off in <2 hours!
Urayama, Fukuyama et al.

Type I Nb in 2014 ~\$420/kg

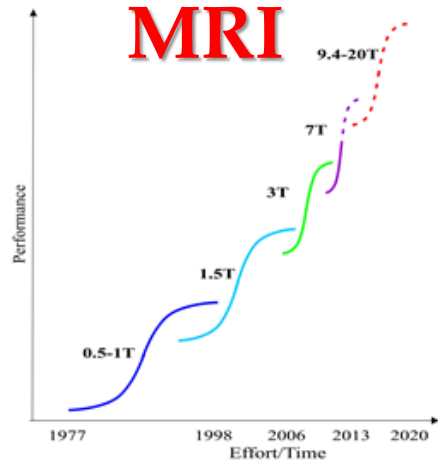

Sn in 2014 ~\$18/kg

Cu in 2014 ~\$6/kg

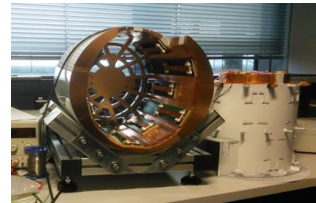

"Helium free" Philips Ingenia Ambition X 1.5T MR

- Slow start (imaging principle unclear, breakthrough, potential not clear compared to CT, cost), 80s economic recession
- Acceleration has been driven by increase in image quality (phased-array RF coils), **magnetic field** and cost decrease

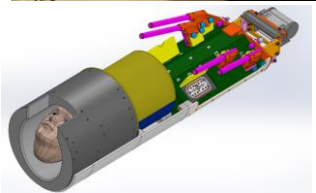

2018

- 3T : \approx 6000 installed systems
- 7T : \approx 50 installed systems (FDA certification in 2017!)
- 1 @ 8T and 5 @ 9.4T systems (USA, Germany)
- 1 system @ 10.5T (Minneapolis)
- 3 orders @ 11.7T : F, USA, Corea
- 1 project @ 11.7T or 14T: Germany
- 1 project @ 14T or 20T: USA

12Tx/22Rx coil (7T)

New directions in science are launched by new tools much more often than by new concepts.
The effect of a concept-driven revolution is to explain old things in new ways. The effect of a **tool-driven revolution** is to **discover new things that have to be explained.**

Freeman Dyson (1997) *Imagined Worlds* Harvard University Press

Toward 14 & 20T?

Superconducting Materials for Magnets

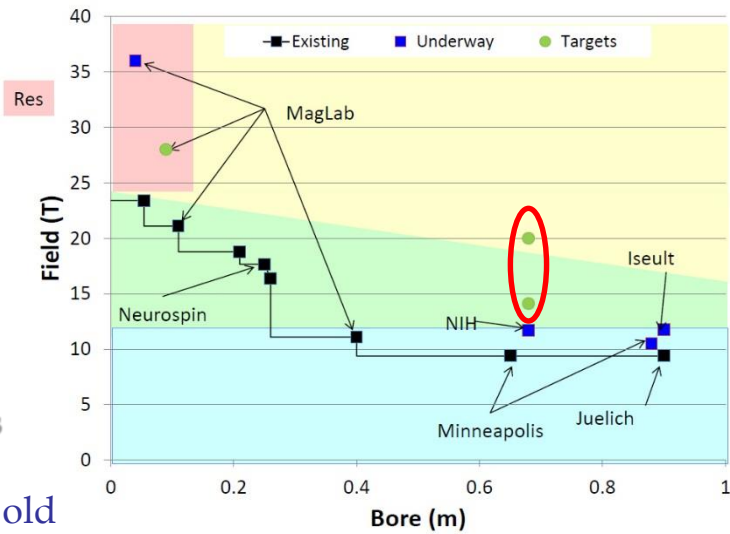

The High-Temperature Superconductors (HTS) YBCO, Bi2212, Bi2223 will superconduct at fields >100T.

For 30 T SC, HTS is required.

At 4 K, extremely high combinations of field and current-density attained!

For 20 T MRI, HTS will likely be preferred over Nb₃Sn.

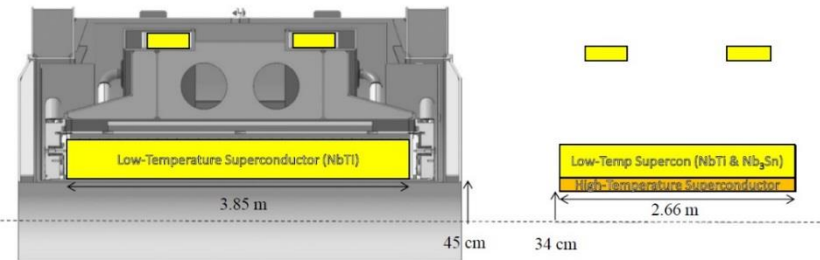

NbTi only Nb₃Sn Required High Temperature Superconductors

Perspective on 20 T MRI Magnet

11.75 T, 90 cm Whole-Body
Under Construction, due 2014 (Iseult)

20 T, 68 cm Head-Only
Preliminary Concept

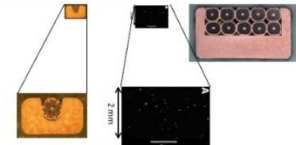

Parameter	Iseult	MagLab 20 T Concept
Conductor Mass (Ton)	65	~35
Stored Energy (MJ)	338	~350
Current Density (A/mm ²)	26.4	~40
Magnet Design	CEA	MagLab

HTS + high-strength materials at 4 K operate at high field and current-density resulting in compact magnets.

MRI Magnet Conductor Design

	3 T, 90 cm	21 T, 10 cm	11.74 T, 90 cm (Iseult)	14 T, 68 cm (proposed)
Superconductor	NbTi	Nb ₃ Sn	NbTi	Nb ₃ Sn
# of strands	1	1	10	100
Current (Amps)	~300	285	1,500	10,000
Reinforcement	Cu	Steel	Cu	Steel
Strength (MPa)	>250	1,400	>250	1,400
Stiffness (GPa)	110	200	110	200
Stabilizer	Cu	Cu	He	He
C _p (mJ/cc/K)	1	1	552	552
Protection	Cu	Cu	Cu	Cu
J _{cu} (A/mm ²)	~280	~230	~70	~250

1,400 / 250 = 5.6 > 3.14
